Breakthrough Software Enables Web-Based Distributed Document Capture

Chicago-Area Firm Partners in Development of Low-Cost, High-Speed Solution

Itasca, Illinois, September 29, 2000

Integrated-Document Technologies, Inc. (IDT) announced today that it is one of the first companies in the U.S. to offer Quillix™, a revolutionary new Web browser-based distributed document capture solution from Prevalent Software, Inc., Colorado Springs, CO. IDT, a leading document management system consultant and software designer, is a development partner and Premier Reseller for the Quillix system, now making it available as part of its full line of document imaging solutions for manufacturers, insurance firms, banks and other financial service organizations.

Quillix is the first true Browser Based Document and Information Capture system built for the Internet, and the first electronic system to solve the problem of capturing and distributing information inexpensively. "Quillix brings together proven technologies, including open architecture design, TWAIN scanning format and XML-based Internet forms, to bring the promise of Internet distributed capture to life," said Paul Szemplinski, IDT president. "It will save companies millions of dollars and speed their business processes."

The Quillix system offers users significant cost-savings compared with central or distributed document capture systems because it delivers document capture capabilities direct to users via the Web. It, therefore, eliminates the need for system administrators to install proprietary software and expensive scanners at each user station—dramatically lowering the per-user total cost. Additional cost-savings come from the elimination of express-mail and other document shipping expenses.

Low Cost, High Performance

Quillix enables users to scan, index and review paper documents, photographs and text forms (including legal contracts) using common desktop scanners, digital cameras, Web forms, Web browsers and Web servers. User accounts, privileges and scanning profiles are also defined and managed in a Web browser client application.

Documents and day-to-day information—such as new bank account applications, insurance applications and claims, or distributor order transmissions to manufacturers—can be managed immediately at the point of origin, instead of being processed later in batches at a central location.

"With Quillix, anyone within an organization with a scanner, Internet connection and Web browser can do what entire document capture departments in many companies do," said Szemplinski. "Even if an organization has a thousand remote offices, Quillix makes capturing and sharing the needed information as easy as browsing the Web."

Small companies will also instantly realize the benefits of the Quillix system. Users simply connect to an Intranet site with the Quillix Web Server installed, where they process and

release documents electronically to any back-end storage system including document imaging, document management, workflow, e-commerce, document processing and data capture systems.

The first release of Quillix supports a direct interface into the Optika® eMedia™ repository. Subsequent release modules are planned for other electronic document repositories, document publishing systems and line-of-business systems.

IDT offers the Quillix system to companies under a licensing agreement, starting with a minimum five-user package.

About IDT

Integrated Document Technologies, Inc. is a leading provider of high performance, client/server, integrated document management and e-commerce solutions.
